

# COMMODITY CONTROL

## in the palm of your hand

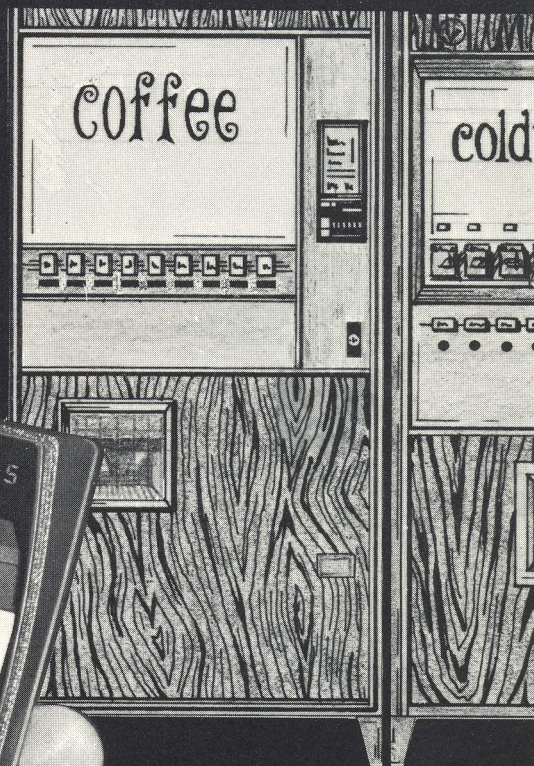

Controlled quality! Controlled profits! The RMi Commoditor places in your hands the simplest, most accurate commodity controls in hot beverage vending.

No mechanical adjustments. No estimated dial settings. The Commoditor's hand-held Service Module allows fast and accurate setting of all commodity dispensing requirements. The digital readout on the Service Module *visually* indicates the exact commodity setting. By simply connecting the Service Module to the control box, all settings are quickly and easily programmed. That means faster setup and on location monitoring.

RMi's carefully engineered and field proven design assures your control of each hot beverage vended. Microcomputer technology controls the dispense time of each commodity and its sequence in the vend cycle. These precise time-adjusted controls determine the amount of product dispensed down to a fraction of a gram. And since only personnel equipped with the Service Module determine these settings, your quality and profits are guaranteed.

Take commodity controls into your own hands.
